

class X {

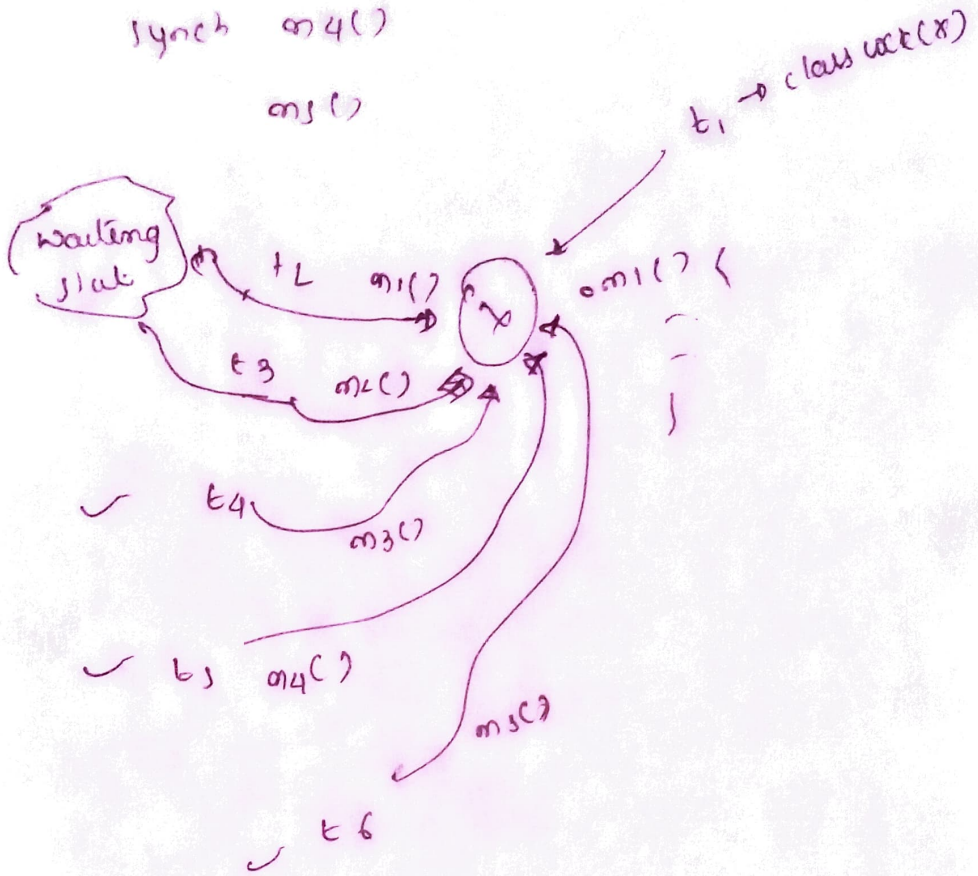

static synchronized m1()

static synchronized m2()

static m3()

synchronized m4()

m5()

class Display {

public void display() {

for(int i=1; i<=10; i++) {

rep(i);

try {

Thread.sleep(2000);

} catch (InterruptedException e) { }

}

```
public void display() {
```

```
for (int i = 65; i <= 90; i++) {
```

```
    sop ((char) i);
```

```
    try {
```

```
        Thread.sleep(2000);
```

```
    } catch (InterruptedException e) { }
```

```
    }
```

```
}
```

```
class myThread1 extends Thread {
```

```
    Display d;
```

```
    myThread1 (Display d) {
```

```
        this.d = d;
```

```
    }
```

```
    public void run() {
```

```
        d.display();
```

```
    }
```

```
class myThread2 extends Thread {
```

```
    Display d;
```

```
    myThread2 (Display d) {
```

```
        this.d = d;
```

```
    }
```

```
    public void run() {
```

```
        d.display();
```

```
    }
```

```
}
```

class SynchronizedDemo {

private String() args) {

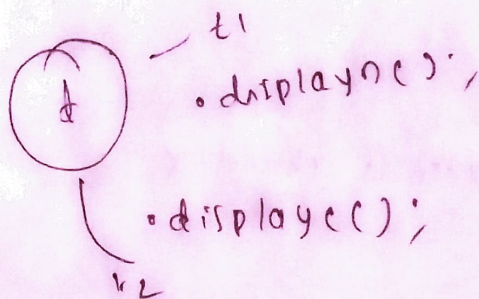

Display d = new Display();

MyThread t1 = new MyThread(d);

MyThread t2 = new MyThread(d);

t1.start();

t2.start();

Synchronized block

synchronized (this) {

...  
}

if a thread got lock of

current object then only

it is allowed to execute

this area

① To get a lock of current object

② To get lock of particular object b.

```
{  
    synchronized (b) {
```

```
}
```

if a thread got lock of

particular object b

then only it is allowed

to execute this area

③ To get class level lock:

```
synchronized (Display.class) {
```

```
}
```

if a thread got class level

lock of Display ~~thread~~ class,

then only it is allowed to

execute this area

```

class Display {
    public void wish(String name) {
        ; ; ; // take input of code
        for(int i=0; i<10; i++){
            pop("Good morning");
        }
        try {
            Thread.sleep(1000);
        }
        catch (InterruptedException) {
            pop("name");
        }
        ; ; ; // take input of code
    }
}

```

```

class MyThread extends Thread {
    display d;
    String name;
    MyThread(d, String name) {}

    this.d = d;
    this.name = name;
}

public void run() {
    for(int i=0; i<
    do wish(name);
}

```

class SynchronisedDemo {

private String[] arrs =

private d = new Display();

MyThread t1 = new MyThread(d, "phonix");

MyThread t2 = new MyThread(d, "yuvraj");

t1.start();

t2.start();

1st provider  
regular output

If we created 2 objects

Display d1 = new Display();

Display d2 = new Display();

MyThread t1 = new MyThread(d1, "phonix");

MyThread t2 = new MyThread(d2, "yuvraj");

t1.start();

t2.start();

irregular output

t1

d1

call("phonix");

d2

call("yuvraj");

1. class level access

In myThread class place for loop in  
synchronized (display.class) {

```
    synchronized (display.class) {  
        for (int i=0; i<10; i++) {  
            sop("Good morning");  
            try {  
                Thread.sleep(2000);  
            }  
            catch (InterruptedException e) { }  
            sop(name);  
        }  
    }
```

```
    display d1 = new display();  
    display d2 = new display();  
    myThread t1 = new myThread(d1, "dhanu");  
    myThread t2 = new myThread(d2, "yuvraj");  
    t1.start();  
    t2.start();
```

output will be  
regular in nature

lock is available for

- object level
- class level

lock is not available for primitives

int x = 10;

synchronized (x) {

    // ...  
}

throws compile error

unexpected type found: int  
required: reference

lock concept applicable for

- object types
- class types

but not for primitives here we can't pass primitive type as argument to

synchronized block.

Other wise we will get compile time error

Solving:

unexpected type

found: int

required: reference

## FAQs

① What is synchronized keyword where we can apply?

• modifier applicable for methods, blocks, but not for variables and classes.

② Explain advantage of synchronized keyword?

we can resolve data inconsistency problems

③ Explain disadvantage of synchronized keyword?

It increases waiting time of threads and creates performance problems

④ What is race condition?

If multiple threads are operating simultaneously on the same Java object, there may arise a data inconsistency problem that is called a race condition

If multiple threads are operating simultaneously on same java object then there may be change of data inconsistency this is called race condition problem.

We can overcome this problem by using synchronized keyword.

⑤ What is Object lock? and when is it required?

Every object in java has a unique lock which is nothing but object level lock.

When ever a thread wants to execute instance synchronized method, then the thread requires object level lock.

⑥ What is class level lock? when is it required?

Every class in java has a unique lock which is nothing but class level lock.

When ever if a thread wants to execute static synchronized method then the thread requires this level lock.

- ⑦ class level lock V/s object level lock
- |   |   |
|---|---|
| <p>↓</p> <p>thread wants<br/>to execute static<br/>synchronized method<br/>then class level<br/>lock needed</p> | <p>thread wants<br/>to execute instance<br/>synchronized method<br/>then object level<br/>lock needed</p> |
|---|---|

⑧ while a thread executing synchronized method on the given object, all the remaining threads are allowed to execute any other synchronized method simultaneously on the same object

• NO

⑨ what is synchronized block

- ⑩ How to declare synchronized block
- to get lock of current object

```
synchronized (this) {  
    }  
}
```

- ⑪ How to declare synchronized block
- to get class level lock

```
synchronized (ClassName.class) {  
    }  
}
```

- ⑫ what is the advantage of synchronized block over synchronized method?

```
• performance by default will  
  be improved  
• waiting times of thread  
  will be reduced
```

(13)

Is a thread can acquire multiple locks simultaneously ?

• ~~No~~ Yes • from different object

class X {

public synchronized void m1() {

→ here thread has lock of X object

Y y = new Y();

here thread has  
locks of X & Y

synchronized(y) {

Z z = new Z();

synchronized(z) {

here thread has

locks of X, Y, Z

X x = new X();

x.m1();

A thread can acquire multiple locks simultaneously from different objects

14) What is synchronized statement?

The statements present in synchronized methods and statements present in synchronized block, are called synchronized statements
